

A note from IT

To enhance security and reduce potential risks associated with publicly accessible web servers, IT has made it a requirement to be connected to the university network in order to access the College Intranet (<https://intranet.trinity.ox.ac.uk/>).

This means you must be connected via one of the following:

- The college's wired or wireless network
- Eduroam
- Any other network within the University of Oxford
- The University VPN (for academic staff and students) if you are outside of Oxford, for example working from home or abroad - for help with configuring the University VPN - <https://help.it.ox.ac.uk/vpn>
- The College VPN (for administrative staff) working remotely connected with your college issued device - If you need help with this, please email helpdesk@trinity.ox.ac.uk

Publicly accessible web servers can be targeted by attackers seeking to exploit vulnerabilities, gain unauthorized access, or disrupt services. They can expose sensitive data, serve as entry points into internal networks, and be used for launching broader cyberattacks.
